Music Data Analysis Using Spark, Hive, HBase , Sqoop

- Prachi Mohite

Section – 1 - Project Overview

A leading music-catering company is planning to analyze large amount of data received from varieties of sources, namely mobile app and website to track the behavior of users, classify users, calculate royalties associated with the song and make appropriate business strategies. The file server receives data files periodically after every 3 hours.

1.1 Fields present in the data files

Data files contain below fields.

Column Name/Field Name	Column Description/Field Description
User_id	Unique identifier of every user
Song_id	Unique identifier of every song
Artist_id	Unique identifier of the lead artist of the song
Timestamp	Timestamp when the record was generated
Start_ts	Start timestamp when the song started to play
End_ts	End timestamp when the song was stopped
Geo_cd	Can be 'A' for USA region, 'AP' for asia pacific region,'J' for Japan region, 'E' for europe and 'AU' for australia region
Station_id	Unique identifier of the station from where the song was played
Song_end_type	How the song was terminated. 0 means completed successfully 1 means song was skipped 2 means song was paused 3 means other type of failure like device issue, network error etc.
Like	0 means song was not likedsong was played 1 means song was liked
Dislike	0 means song was not disliked 1 means song was disliked

1.2 LookUp Tables

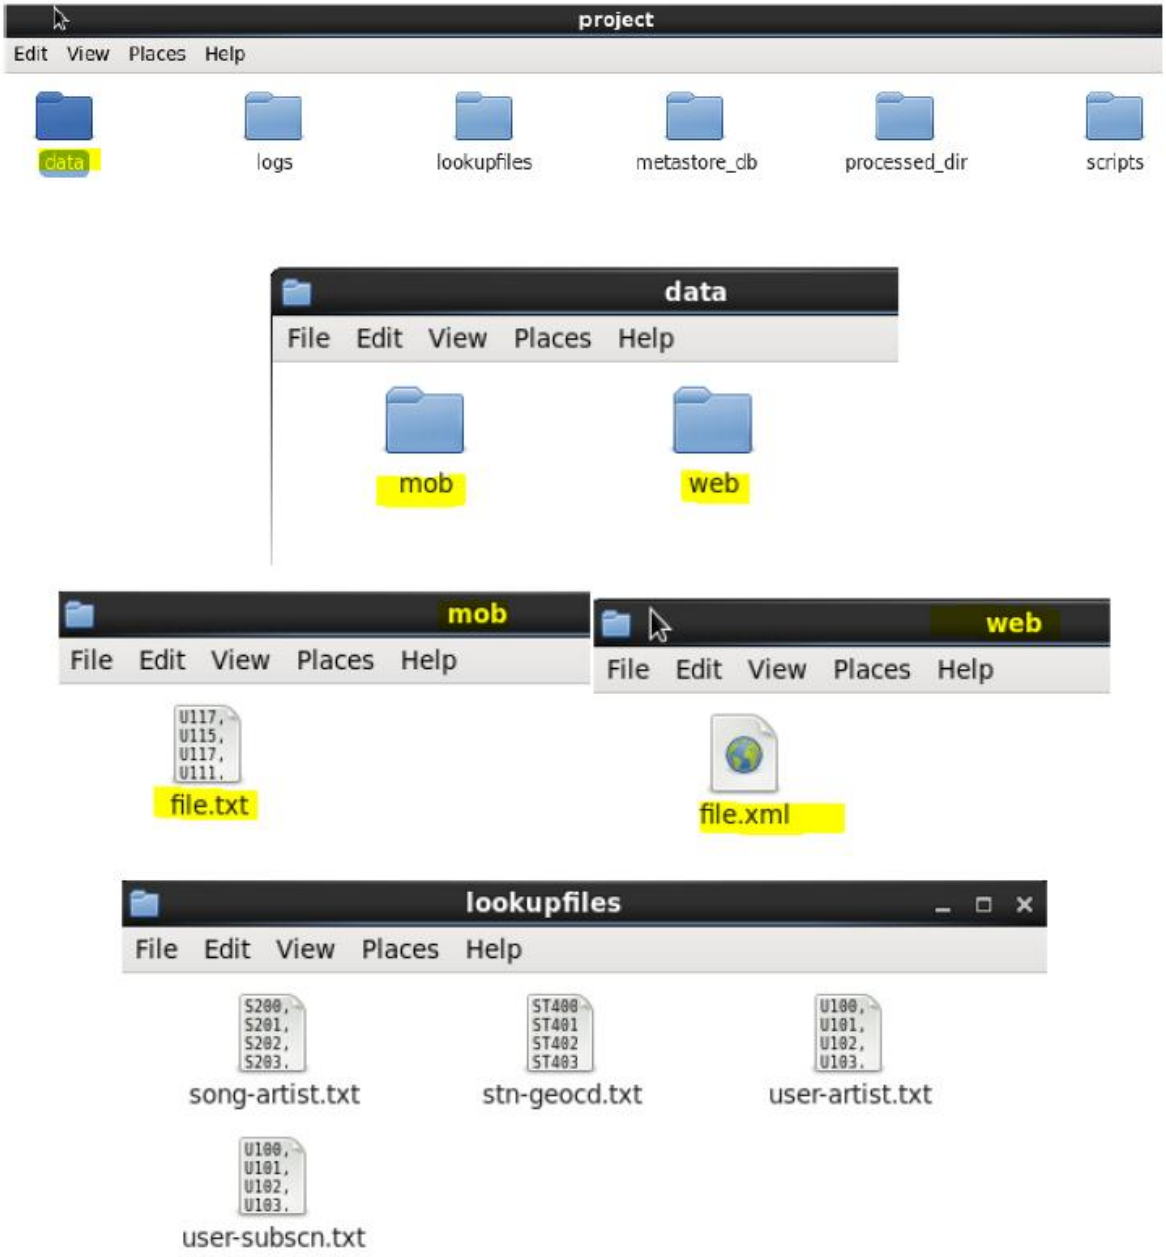
There are some existing look up tables present in **NoSQL** databases. They play an important role in data enrichment and analysis.

Table Name	Description
Station_Geo_Map	Contains mapping of a geo_cd with station_id
Subscribed_Users	Contains user_id, subscription_start_date and subscription_end_date. Contains details only for subscribed users
Song_Artist_Map	Contains mapping of song_id with artist_id alongwith royalty associated with each play of the song
User_Artist_Map	Contains an array of artist_id(s) followed by a user_id

1.3 DATASET

1. Data coming from web applications reside in /data/web and has xml format.
2. Data coming from mobile applications reside in /data/mob and has csv format.
3. Data present in lookup directory should be used in HBase.

Below is the link for same.
https://drive.google.com/drive/folders/0B_P3pWagdIrrMjJGVlNsSUEtbG8?usp=sharing



1.4 Data Enrichment

Rules for data enrichment,

1. If any of like or dislike is NULL or absent, consider it as 0.
2. If fields like **Geo_cd** and **Artist_id** are NULL or absent, consult the lookup tables for fields

Station_id and **Song_id** respectively to get the values of **Geo_cd** and **Artist_id**.

3. If corresponding lookup entry is not found, consider that record to be invalid.

NULL or absent field	Look up field	Look up table (Table from which record can be updated)
Geo_cd	Station_id	Station_Geo_Map
Artist_id	Song_id	Song_Artist_Map

1.5 Data Analysis (SHOULD BE IMPLEMETED IN SPARK)

It is not only the data which is important, rather it is the insight it can be used to generate important. Once we have made the data ready for analysis, we have to perform below analysis on a daily basis.

1. Determine top 10 station_id(s) where maximum number of songs were played, which were liked by unique users.
2. Determine total duration of songs played by each type of user, where type of user can be 'subscribed' or 'unsubscribed'. An unsubscribed user is the one whose record is either not present in Subscribed_users lookup table or has subscription_end_date earlier than the timestamp of the song played by him.
3. Determine top 10 connected artists. Connected artists are those whose songs are most listened by the unique users who follow them.
4. Determine top 10 songs who have generated the maximum revenue. Royalty applies to a song only if it was liked or was completed successfully or both.
5. Determine top 10 unsubscribed users who listened to the songs for the longest duration.

1.6 Challenges and Optimizations:

1. LookUp tables are in NoSQL databases. Integrate them with the actual data flow.
2. Try to make joins as less expensive as possible.
3. Data Cleaning, Validation, Enrichment, Analysis and Post Analysis have to be automated. Try using schedulers.
4. Appropriate logs have to maintain to track the behavior and overcome failures in the pipeline.

1.7 Flow of operations

A schematic flow of operations is shown below,

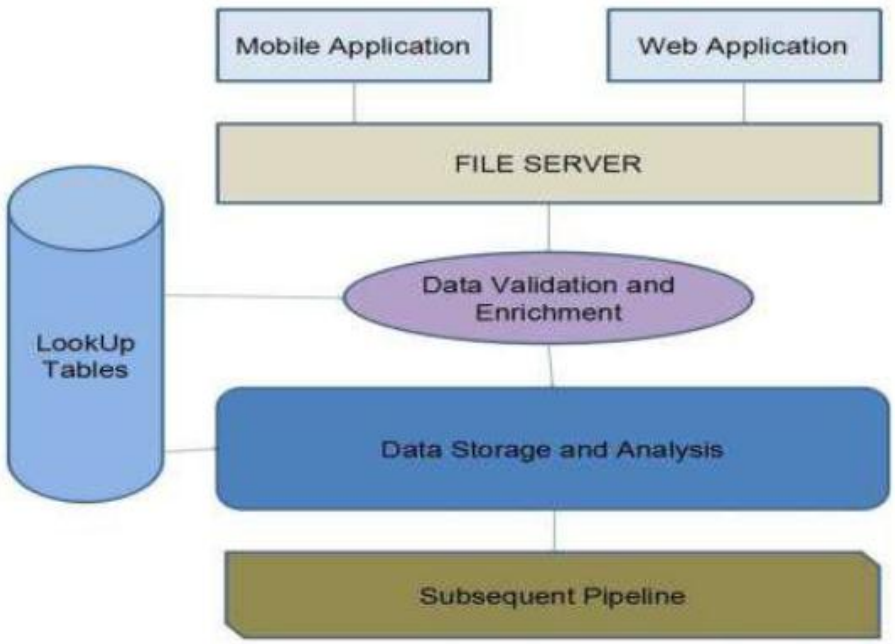


Fig-1

In the following sections, we are going to see the Music Data Analysis as per the above rules.

Section -2 – Design of the Project

2.1 Low Level Design

The following flowchart shows the Low Level design of this project,

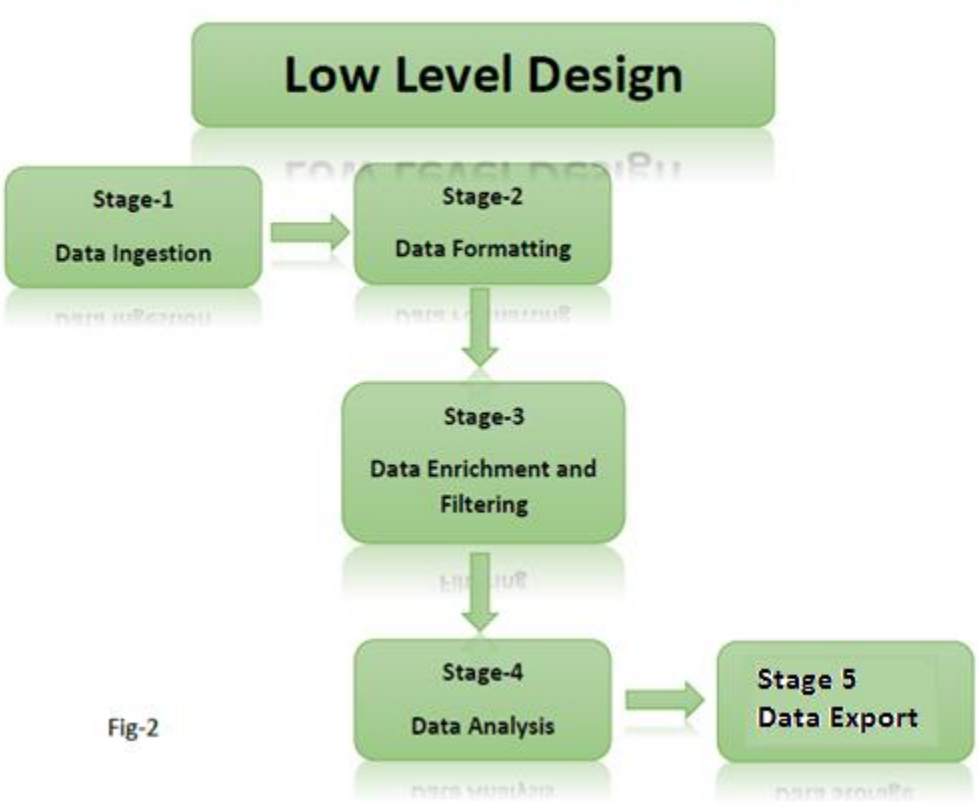

Fig-2

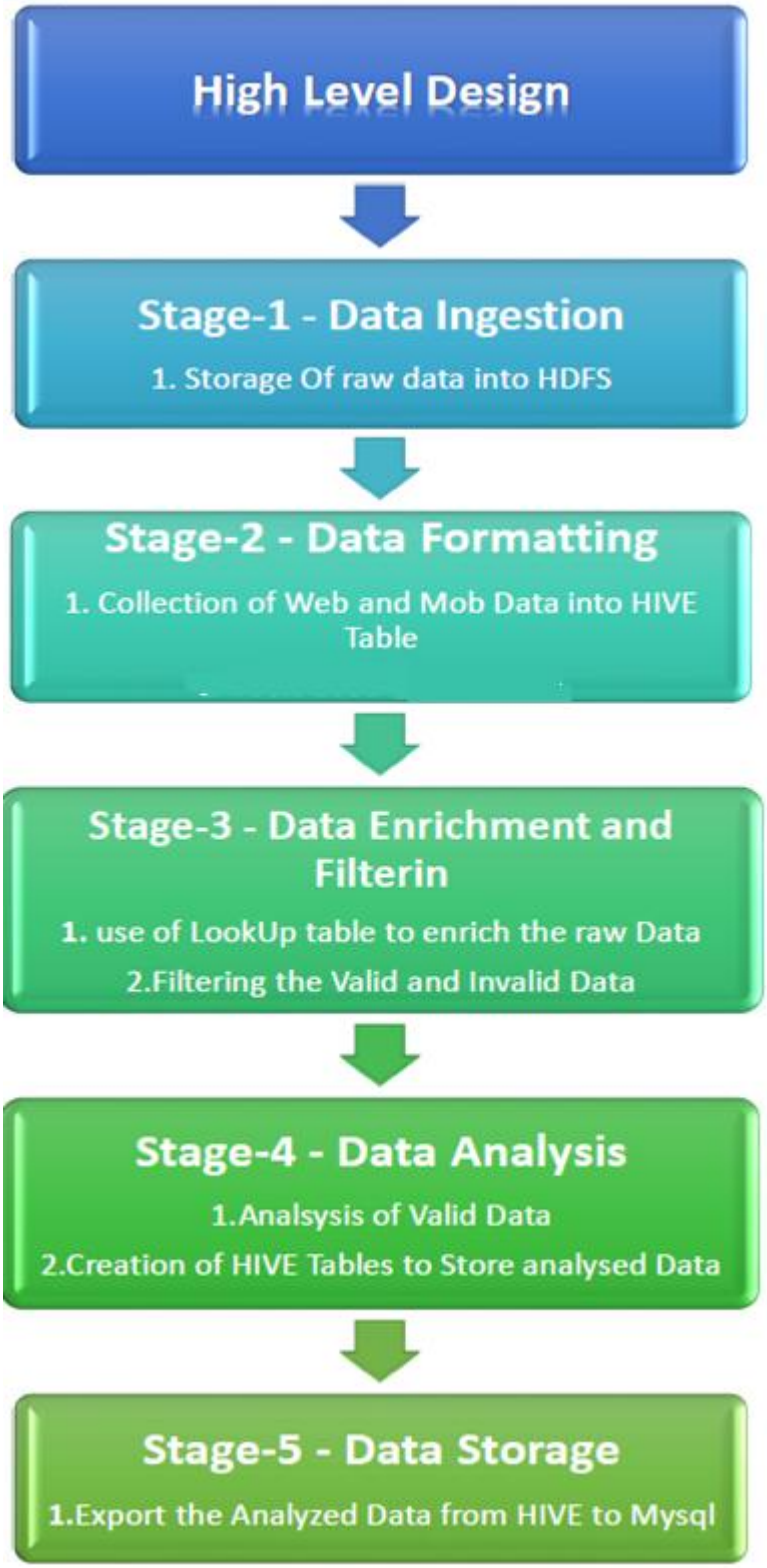
2.2 High Level Design



Section-3-Hadoop Eco-System Implementation

1. We have created a batch file **"start-daemon.sh"** which starts the daemons such as **hive**, **hbase**, **Mysql** and rest of the all **hadoop** daemons.

Batch file script,

```
#!/bin/bash

rm -r /home/acadgild/examples/music/logs
mkdir -p /home/acadgild/examples/music/logs

if [ -f "/home/acadgild/examples/music/logs/current-batch.txt" ]
then
 echo "Batch File Found!"
else
 echo -n "1" > "/home/acadgild/examples/music/logs/current-batch.txt"
fi

chmod 775 /home/acadgild/examples/music/logs/current-batch.txt
echo "After chmod"
batchid=`cat /home/acadgild/examples/music/logs/current-batch.txt`
echo "After batchid-->> "$batchid
LOGFILE=/home/acadgild/examples/music/logs/log_batch_$batchid

echo "Starting daemons" >> $LOGFILE

# To start all Hadoop Daemons
start-all.sh
# To start hbase Daemons
start-hbase.sh
# To start job history server
mr-jobhistory-daemon.sh start historyserver

cat /home/acadgild/examples/music/logs/current-batch.txt
```

Output of the above script is validated through JPS Command

```
[acadgild@localhost music]$ ./music_project_master.sh

```

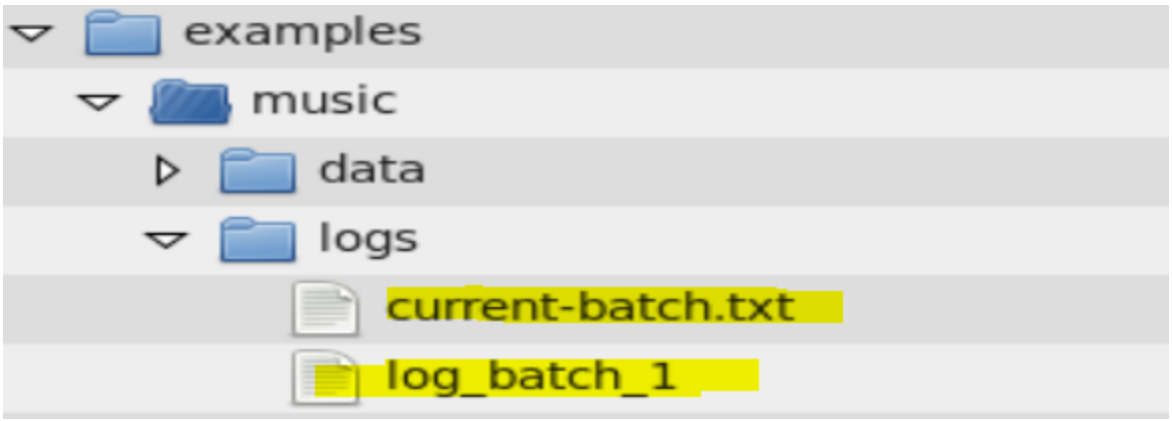
The **start-daemon.sh** script will check whether the current-batch.txt file is available in the logs folder or not. If not it will create the file and dump value ‘1’ in that file and create LOGFILE with the current **batchid**.



2. This start-daemon.sh is getting used in music_project_master.sh , which is master file to execute the different scripts to data ingestion , activating daemons etc.
This is the master file which will be finally scheduled in Crontab for execution in every three hours.

```
# Create data

#sh data_analysis.sh

echo "USE CASES COMPLETE !!"
```

This script includes python scripts to create data.

3. Create data from mobile devices

```
from random import randint
from random import choice

file = open("/home/acadgild/examples/music/data/mob/file.txt", "w")
count = 20

while (count > 0):
        geo_cd_list=["A", "E", "AU", "AP", "U"]
        song_end_type_list=["0","1","2","3"]
        timestamp_list=["1465230523", "1465130523", "1475130523", "1495130523"]
        start_ts_list=["1465230523", "1465130523", "1475130523", "1485130523"]
        end_ts_list=["1465230523", "1465130523", "1475130523", "1485130523"]

        if (count%15 == 0):
                user_id = ""
        else:
                user_id = "U" + str(randint(100,120))

        song_id = "S" + str(randint(200,210))

        if (count%11 == 0):
                artist_id = ""
        else:
                artist_id = "A" + str(randint(300,305))

        timestamp = choice(timestamp_list)
        start_ts = choice(start_ts_list)
        end_ts = choice(end_ts_list)

        if (count%12 == 0):
                geo_cd = ""
        else:
                geo_cd = choice(geo_cd_list)
```

```
        station_id = "ST" + str(randint(400,415))
        song_end_type = choice(song_end_type_list)
        like = str(randint(0,1))
        dislike = str(randint(0,1))

        file.write("%s,%s,%s,%s,%s,%s,%s,%s,%s,%s,%s,%s\n" % (user_id, song_id, artist_id, timestamp, start_ts, end_ts,
geo_cd, station_id, song_end_type, like, dislike))

        count = count-1

file.close()
```

4. Create data from Web

```
from random import randint
from random import choice

file = open("/home/acadgild/examples/music/data/web/file.xml", "w")
count = 20

file.write("<records>\n")

while (count > 0):
        geo_cd_list=["A", "E", "AU", "AP", "U"]
        song_end_type_list=["0","1","2","3"]
        timestamp_list=["2016-05-10 12:24:22", "2016-06-09 22:12:36", "2016-07-10 01:38:09", "2017-05-09 08:09:22"]
        start_ts_list=["2016-05-10 12:24:22", "2016-06-09 22:12:36", "2016-07-10 01:38:09", "2017-05-09 08:09:22"]
        end_ts_list=["2016-05-10 12:24:22", "2016-06-09 22:12:36", "2016-07-10 01:38:09", "2017-05-09 08:09:22"]

        if (count%15 == 0):
                user_id = ""
        else:
                user_id = "U" + str(randint(100,120))

        song_id = "S" + str(randint(200,210))

        if (count%11 == 0):
                artist_id = ""
        else:
                artist_id = "A" + str(randint(300,305))

        timestamp = choice(timestamp_list)
        start_ts = choice(start_ts_list)
        end_ts = choice(end_ts_list)

        if (count%12 == 0):
                geo_cd = ""
```

```
        timestamp = choice(timestamp_list)
        start_ts = choice(start_ts_list)
        end_ts = choice(end_ts_list)

        if (count%12 == 0):
                geo_cd = ""
        else:
                geo_cd = choice(geo_cd_list)

        station_id = "ST" + str(randint(400,415))
        song_end_type = choice(song_end_type_list)
        like = str(randint(0,1))
        dislike = str(randint(0,1))
        file.write("<record>\n")
        file.write("<user_id>%s</user_id>\n" % (user_id))
        file.write("<song_id>%s</song_id>\n" % (song_id))
        file.write("<artist_id>%s</artist_id>\n" % (artist_id))
        file.write("<timestamp>%s</timestamp>\n" % (timestamp))
        file.write("<start_ts>%s</start_ts>\n" % (start_ts))
        file.write("<end_ts>%s</end_ts>\n" % (end_ts))
        file.write("<geo_cd>%s</geo_cd>\n" % (geo_cd))
        file.write("<station_id>%s</station_id>\n" % (station_id))
        file.write("<song_end_type>%s</song_end_type>\n" % (song_end_type))
        file.write("<like>%s</like>\n" % (like))
        file.write("<dislike>%s</dislike>\n" % (dislike))
        file.write("</record>\n")

        count = count-1

file.write("</records>")
file.close()
```

These scripts should be marked as executable and should display in green color if listed.
If it is not displayed as executable execute below command to change the permissions to execute

Chmod 774 /home/acadgild/examples/music/*

Section-4 –Data Ingestion, Formatting, Enrichment & Filtering, Analysis And Export

4.1 Stage – 1 – Data Ingestion

By using the "***populate-lookup.sh"*** script we will create lookup tables in **Hbase**. These tables have to be used in,
Data formatting,
Data enrichment and
Analysis stage

Lookup Tables

Sl.no	Table Name	Description	Related File
1	station-geo-map	Contains mapping of a **geo_cd** with **station_id**	stn-geocd.txt
2	subscribed-users	Contains **user_id, subscription_start_date** and **subscription_end_date.** Contains details only for subscribed users	user-subscn.txt
3	song-artist-map	Contains mapping of **song_id** with **artist_id** Along with royalty associated with each play of the song	song-artist.txt
4	user-artist-map	Contains an array of **artist_id**(s) followed by a **user_id**	user-artist.txt

Table-1

"populate-lookup.sh" script

The "***populate-lookup.sh"*** shell script creates the above 4 lookup tables in the Hbase and populate the data into the lookup tables from the dataset files.
In the below screen shots, we can see the create-lookup.sh scripts and the following screen shots shows the tables creation and population of the data in the Hbase. Also, the values loaded into the Hbase Tables are also shown, please see the below screen shots.

```
#!/bin/bash

Now we need to link theses lookup tables in hive using the Hbase Storage Handler.
With the help of **"data_enrichment_filtering_schema.sh"** file we will create hive tables on the top of Hbase tables using **"create_hive_hbase_lookup.hql".**

Creating Hive Tables on the top of Hbase:
In this section with the help of Hbase storage handler & SerDe properties we are creating the hive external tables by matching the columns of Hbase tables to hive tables.

Run the script: **./data_enrichment_filtering_schema.sh, (through master script only)**

The script will run the **"create_hive_hbase_lookup.hql"** which will create the HIVE external tables with the help of **Hbase storage handler & SerDe properties**. The hive external tables will match the columns of **Hbase** tables to **HIVE** tables.

```
#!/bin/bash

batchid=`cat /home/acadgild/project/logs/current-batch.txt`
LOGFILE=/home/acadgild/project/logs/log_batch_$batchid

echo "Creating hive tables on top of hbase tables for data enrichment and filtering..." >> $LOGFILE

hive -f /home/acadgild/project/scripts/create_hive_hbase_lookup.hql
```

create_hive_hbase_lookup.hql

```
USE project;

hive>
```

4.2 Stage – 2 - Data Formatting

In this stage we are merging the data coming from both **web** applications and **mobile** applications and create a common table for analyzing purpose and create partitioned data based on **batched**.

Run the script: *./dataformatting.sh (Through master script only)*

```
#!/bin/bash

batchid=`cat /home/acadgild/examples/music/logs/current-batch.txt`
LOGFILE=/home/acadgild/examples/music/logs/log_batch_$batchid

echo "Running script for data formatting..." >> $LOGFILE

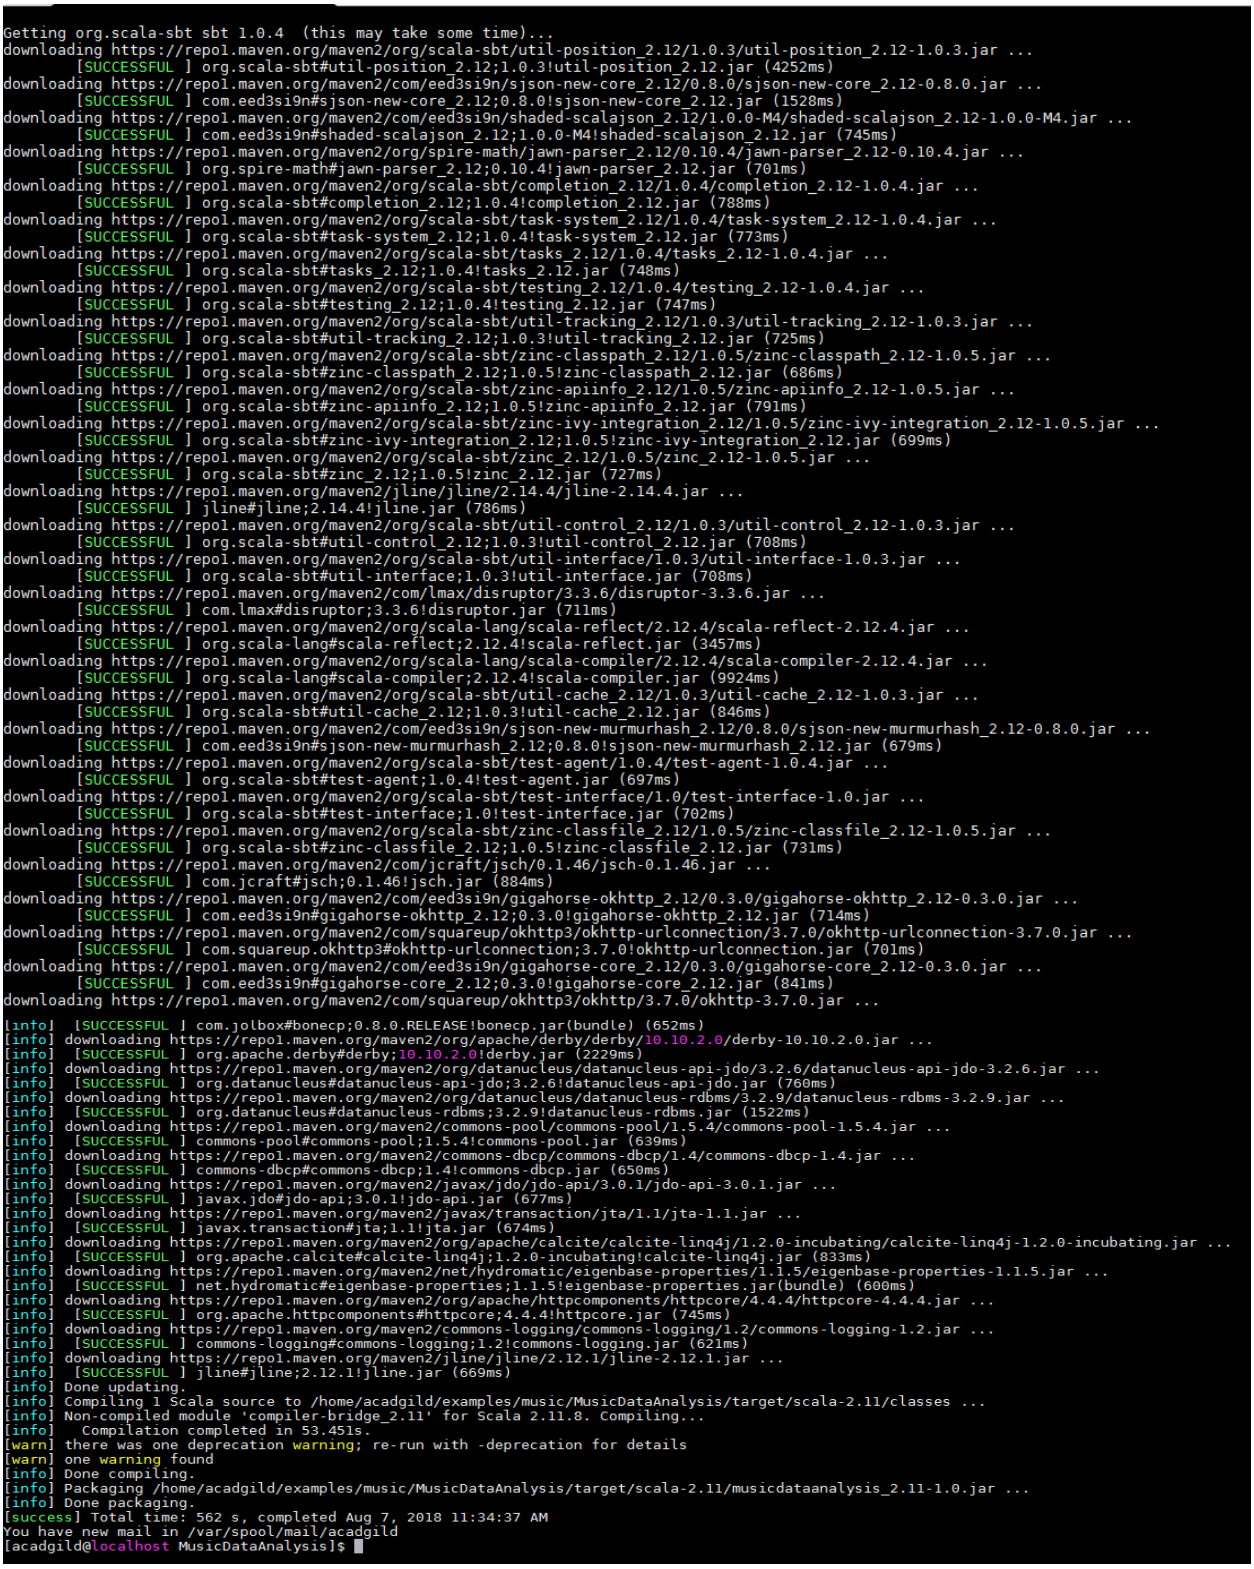
spark-submit --packages com.databricks:spark-xml_2.10:0.4.1 \
--class DataFormatting \
--master local[2] \
/home/acadgild/examples/music/MusicDataAnalysis/target/scala-2.11/musicdataanalysis_2.11-1.0.jar $batchid
```

Here we can see DataFormatting class will be submitted by Spark.
But prior to execution of above – get all the dependent jars downloaded for DataFormatting.scala using **sbt –v package** command (might take 30mins). This command downloads all the JARs required for the dependencies mentioned in the **buid.sbt** file.

Execution of sbt –v package

```
[acadgild@localhost MusicDataAnalysis]$ sbt -v package
[process_args] java_version = '1.8'
# Executing command line:
java
-Xms1024m
-Xmx1024m
-XX:ReservedCodeCacheSize=128m
-XX:MaxMetaspaceSize=256m
-jar
/usr/share/sbt/bin/sbt-launch.jar
package

Getting org.scala-sbt sbt 1.0.4  (this may take some time)...
```



Dataformatting.scala

```
import org.apache.spark.{SparkConf, SparkContext}
import org.apache.spark.sql

object DataFormatting {
  def main(args: Array[String]): Unit = {
    val conf = new SparkConf().setAppName("Data Formatting")
    val sc = new SparkContext(conf)
    val sqlContext = new org.apache.spark.sql.hive.HiveContext(sc)
    val batchId = args(0)
    val create_hive_table = """CREATE TABLE IF NOT EXISTS project.formatted_input
                              (
                              User_id STRING,
                              Song_id STRING,

                              song_id,
                              artist_id,
                              unix_timestamp(timestamp,'yyyy-MM-dd HH:mm:ss') AS timestamp,
                              unix_timestamp(start_ts,'yyyy-MM-dd HH:mm:ss') AS start_ts,
                              unix_timestamp(end_ts,'yyyy-MM-dd HH:mm:ss') AS end_ts,
                              geo_cd,
                              station_id,
                              song_end_type,
                              like,
                              dislike
                              FROM web_data
                              """

    try {
      val xmlData = sqlContext.read.format( source = "com.databricks.spark.xml").option("rowTag", "record").load( path = "/home/acadgild/project/data/web/file.x
      xmlData.createOrReplaceTempView( viewName = "web_data")

      sqlContext.sql(create_hive_table)
      sqlContext.sql(load_mob_data)
      sqlContext.sql(load_web_data)
    }
    catch{
      case e: Exception=>e.printStackTrace()
    }
  }
}
```

Make sure that Hive metastore service (use command – "***hive –service metastore***") is running and then we are executing ***dataformatting.sh***

We can submit your Spark application to a Spark deployment environment for execution, kill or request status of Spark applications.

Dataformatting.sh

```
#!/bin/bash

batchid=`cat /home/acadgild/examples/music/logs/current-batch.txt`
LOGFILE=/home/acadgild/examples/music/logs/log_batch_$batchid

echo "Running script for data formatting..." >> $LOGFILE

spark-submit --packages com.databricks:spark-xml_2.10:0.4.1 \
--class DataFormatting \
--master local[2] \
/home/acadgild/examples/music/MusicDataAnalysis/target/scala-2.11/musicdataanalysis_2.11-1.0.jar $batchid
```

Execution of hive service metastore

```

```

In the above screenshot we can see the formatted input data with some null values in **user_id, aritist_id** and **geo_cd** columns which we will fill the enrichment script based on rules of enrichment for **artist_id** and **geo_cd** only. We will get neglect **user_id** because they didn't mention anything about **user_id** for enrichment purpose.

4.3 Data Enrichment and filtering

In this stage, we will enrich the data coming from **web** and **mobile** applications using the lookup table stored in **Hbase** and divide the records based on the enrichment rules into '**pass'** and '**fail'** records.
Rules for data enrichment:

1. If any of like or dislike is **NULL** or absent, consider it as **0**.
2. If fields like **Geo_cd** and **Artist_id** are NULL or absent, consult the lookup tables for fields **Station_id** and **Song_id** respectively to get the values of **Geo_cd** and **Artist_id.**
3. If corresponding lookup entry is not found, consider that **record** to be **invalid.**

So based on the enrichment rules we will fill the null **geo_cd** and **artist_id** values with the help of corresponding lookup values in **song-artist-map** and **station-geo-map** tables in **Hive-Hbase** tables.
data_enrichment.sh

```
#!/bin/bash

batchid=`cat /home/acadgild/project/logs/current-batch.txt`
LOGFILE=/home/acadgild/examples/music/logs/log_batch_$batchid
VALIDDIR=/home/acadgild/examples/music/processed_dir/valid/batch_$batchid
INVALIDDIR=/home/acadgild/examples/music/processed_dir/invalid/batch_$batchid

echo "Running script for data enrichment and filtering..." >> $LOGFILE

```

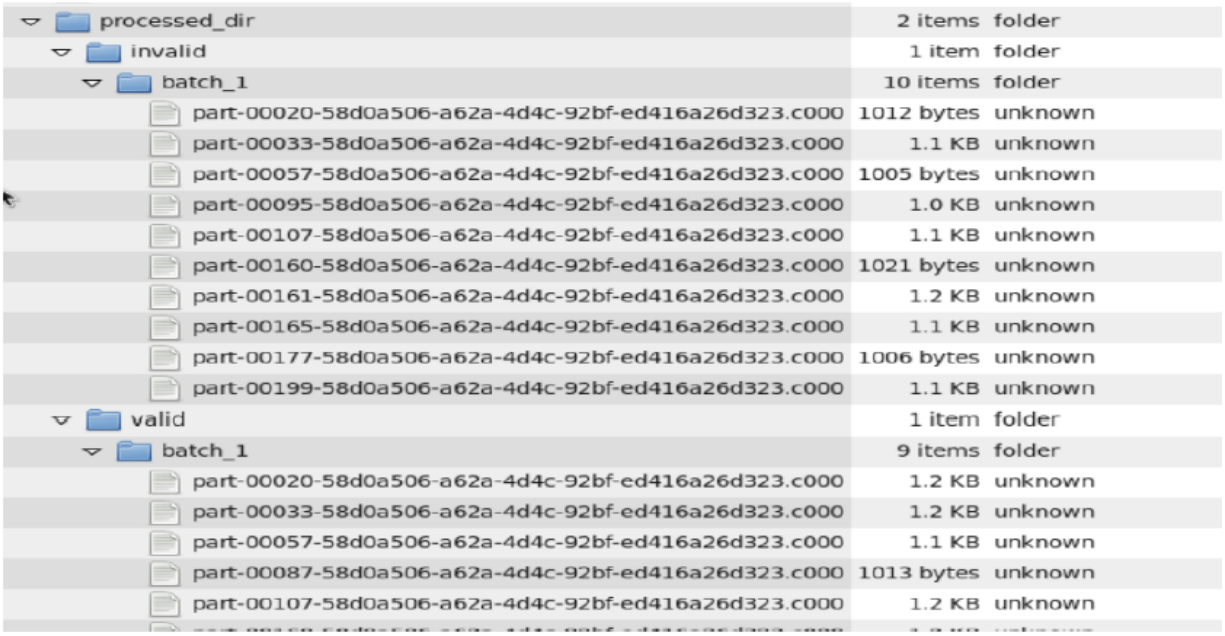
In the above screenshot we can see the records are categorised as “pass” or “fail”.
All the **“pass”** records are accumulated in **“processed_dir/valid/batch_1”** and “**fail”** records are accumulated in **“processed_dir/invalid/batch_1” (**refer below screenshot**)**



4.4 Data Analysis

In this stage we will do analysis on enriched data using Spark SQL and run the program using Spark Submit command.

All the Spark SQL are captured in ***DataAnalysis.scala*** which will be internally triggered by ***data_analysis.sh.***

```
#!/bin/bash

batchid=`cat /home/acadgild/example/music/logs/current-batch.txt`
LOGFILE=/home/acadgild/example/music/logs/log_batch_$batchid

      sqlContext.sql( sqlText = "SET hive.auto.convert.join=false")
      sqlContext.sql( sqlText = "USE project")
      sqlContext.sql(create_top_10_stations)
      sqlContext.sql(load_top_10_stations)
      sqlContext.sql(create_users_behaviour)
      sqlContext.sql(load_users_behaviour)
      sqlContext.sql(create_connected_artists)
      sqlContext.sql(load_connected_artists)
      sqlContext.sql(create_top_10_royalty_songs)
      sqlContext.sql(load_top_10_royalty_songs)
      sqlContext.sql(create_top_10_unsubscribed_users)
      sqlContext.sql(load_top_10_unsubscribed_users)
    }
    catch{
      case e: Exception=>e.printStackTrace()
    }
  }
}
```

After executing the above script, we would get the below

```
18/07/24 22:00:50 INFO scheduler.OutputCommitCoordinator$OutputCommitCoordinatorEndpoint: OutputCommitCoordinator st
18/07/24 22:00:50 INFO spark.SparkContext: Successfully stopped SparkContext
18/07/24 22:00:50 INFO util.ShutdownHookManager: Shutdown hook called

hive>
```

So we have successfully completed the data analysis for the given dataset. But now – we look forward to store the results. This is explained in the next section – we have implemented it by using the "export" concept of sqoop as mentioned in the script - ***data_export.sh***.

4.5 Data Export

In **data_export.sh** we are going to export the data from the hive tables into mysql using **Sqoop** export.
data_export.sh

```
#!/bin/bash

#This script is not working.
#Either change table to text or use STRING as type of partitioned column

batchid=`cat /home/acadgild/examples/music/logs/current-batch.txt`
LOGFILE=/home/acadgild/examples/music/logs/log_batch_$batchid

echo "Creating mysql tables if not present..." >> $LOGFILE

mysql -u "root" "-pRoot@123" < /home/acadgild/examples/music/create_schema.sql

echo "Running sqoop job for data export...AnkithTest" >> $LOGFILE

sqoop export --connect jdbc:mysql://localhost/project --username root --password Root@123 --table top_10_stations --export-
dir /user/hive/warehouse/project.db/top_10_stations/batchid=$batchid --input-fields-terminated-by ',' -m 1

sqoop export --connect jdbc:mysql://localhost/project --username root --password Root@123 --table users_behaviour  --export-
dir /user/hive/warehouse/project.db/users_behaviour/batchid=$batchid --input-fields-terminated-by ',' -m 1

sqoop export --connect jdbc:mysql://localhost/project --username root --password Root@123 --table connected_artists --export-
dir /user/hive/warehouse/project.db/connected_artists/batchid=$batchid --input-fields-terminated-by ',' -m 1

sqoop export --connect jdbc:mysql://localhost/project --username root --password Root@123 --table top_10_royalty_songs --
export-dir /user/hive/warehouse/project.db/top_10_royalty_songs/batchid=$batchid --input-fields-terminated-by ',' -m 1

sqoop export --connect jdbc:mysql://localhost/project --username root --password Root@123 --table top_10_unsubscribed_users --
export-dir /user/hive/warehouse/project.db/top_10_unsubscribed_users/batchid=$batchid --input-fields-terminated-by ',' -m 1
```

create_schema.sql

```
CREATE DATABASE IF NOT EXISTS project;

USE project;

CREATE TABLE IF NOT EXISTS top_10_stations
(
station_id VARCHAR(50),
total_distinct_songs_played INT,
distinct_user_count INT
);

CREATE TABLE IF NOT EXISTS users_behaviour
(
user_type VARCHAR(50),
duration BIGINT
);

CREATE TABLE IF NOT EXISTS connected_artists
(
artist_id VARCHAR(50),
user_count INT
);

CREATE TABLE IF NOT EXISTS top_10_royalty_songs
(
song_id VARCHAR(50),
duration BIGINT
);

CREATE TABLE IF NOT EXISTS top_10_unsubscribed_users
(
user_id VARCHAR(50),
duration BIGINT
```

Now we can see the export using export sqoop is in-progress.

```
Let us export the final data....

```

4.6 Job Scheduling

For scheduling, the master file - music_project_master.sh, which holds all the scripts used in the Project, should run in a period of every 3 hours.
This scheduling can usually be done using the crontab. As of now, we are not going to schedule the file since this project was a self-learning activity where we had only one input batch files.

4.7 Problems faced during project installation and how it resolved

1. The frequent error was the metastore service was not connected due to which I had trouble on creation of hbase tables.
2. To execute the metastore service we have to make sure , mysql is up and running.
3. to execute the shell scripts we had to make sure those scripts have permission to execute, Or can be modified by using chmod command.
